AUXILIA

AI-Powered Parametric Income Protection for Gig Workers

THE PROBLEM

- Gig workers lose earnings during active shifts when disruptions hit — rain, traffic, road incidents, low demand.
- No existing protection is built for short 10–20 min delivery windows.
- City-wide insurance averages ignore zone-level risk differences.
- Gig workers are reluctant to trust a new financial platform with their personal and payment data

WHAT IS AUXILIA

- Weekly income-protection platform for Q-commerce and food delivery riders
- A parametric model with predefined triggers, that facilitates automatic claim evaluation and fast payout.
- Purely intended for operational disruption coverage

HOW IT WORKS?

1. Rider buys weekly coverage via the app
2. Backend continuously monitors live disruption signals
3. Rider submits a claim; fraud checks run automatically
4. Eligible claims are paid out instantly via simulated settlement

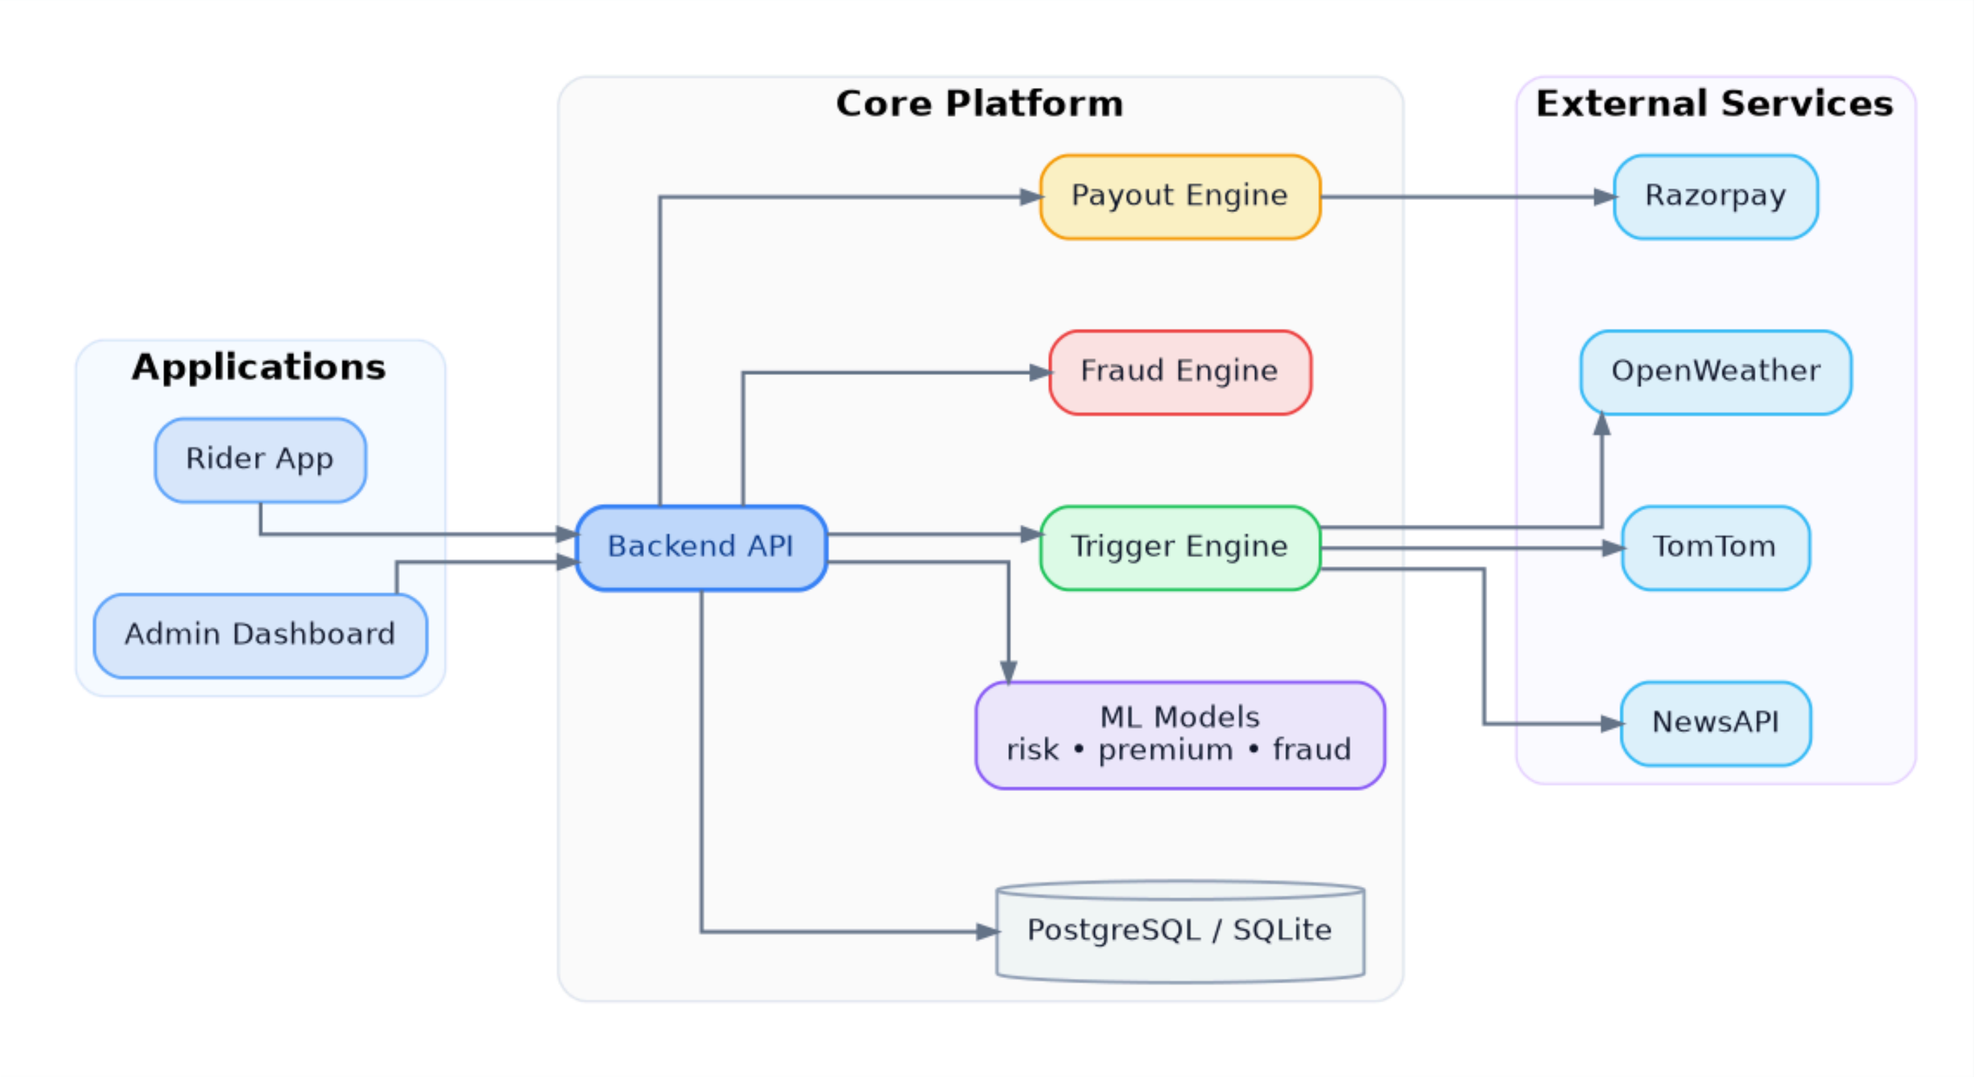
KEY DIFFERENTIATORS

- Zone first logic : risk is evaluated at delivery zone level, not city average
- Multi trigger model : Takes rain , traffic, road incidents and low demand surge into account.
- Short window tuned : Focuses on 10 20 min delivery cycles.
- Explainable claims: Transparent check by check status visible to ride and admin
- Privacy-first design : anonymous logs used for risk prediction and payment processing, minimizing personal data exposure
- Loyalty rewards : continuous usage is rewarded with loyalty points, building long-term trust and reducing churn

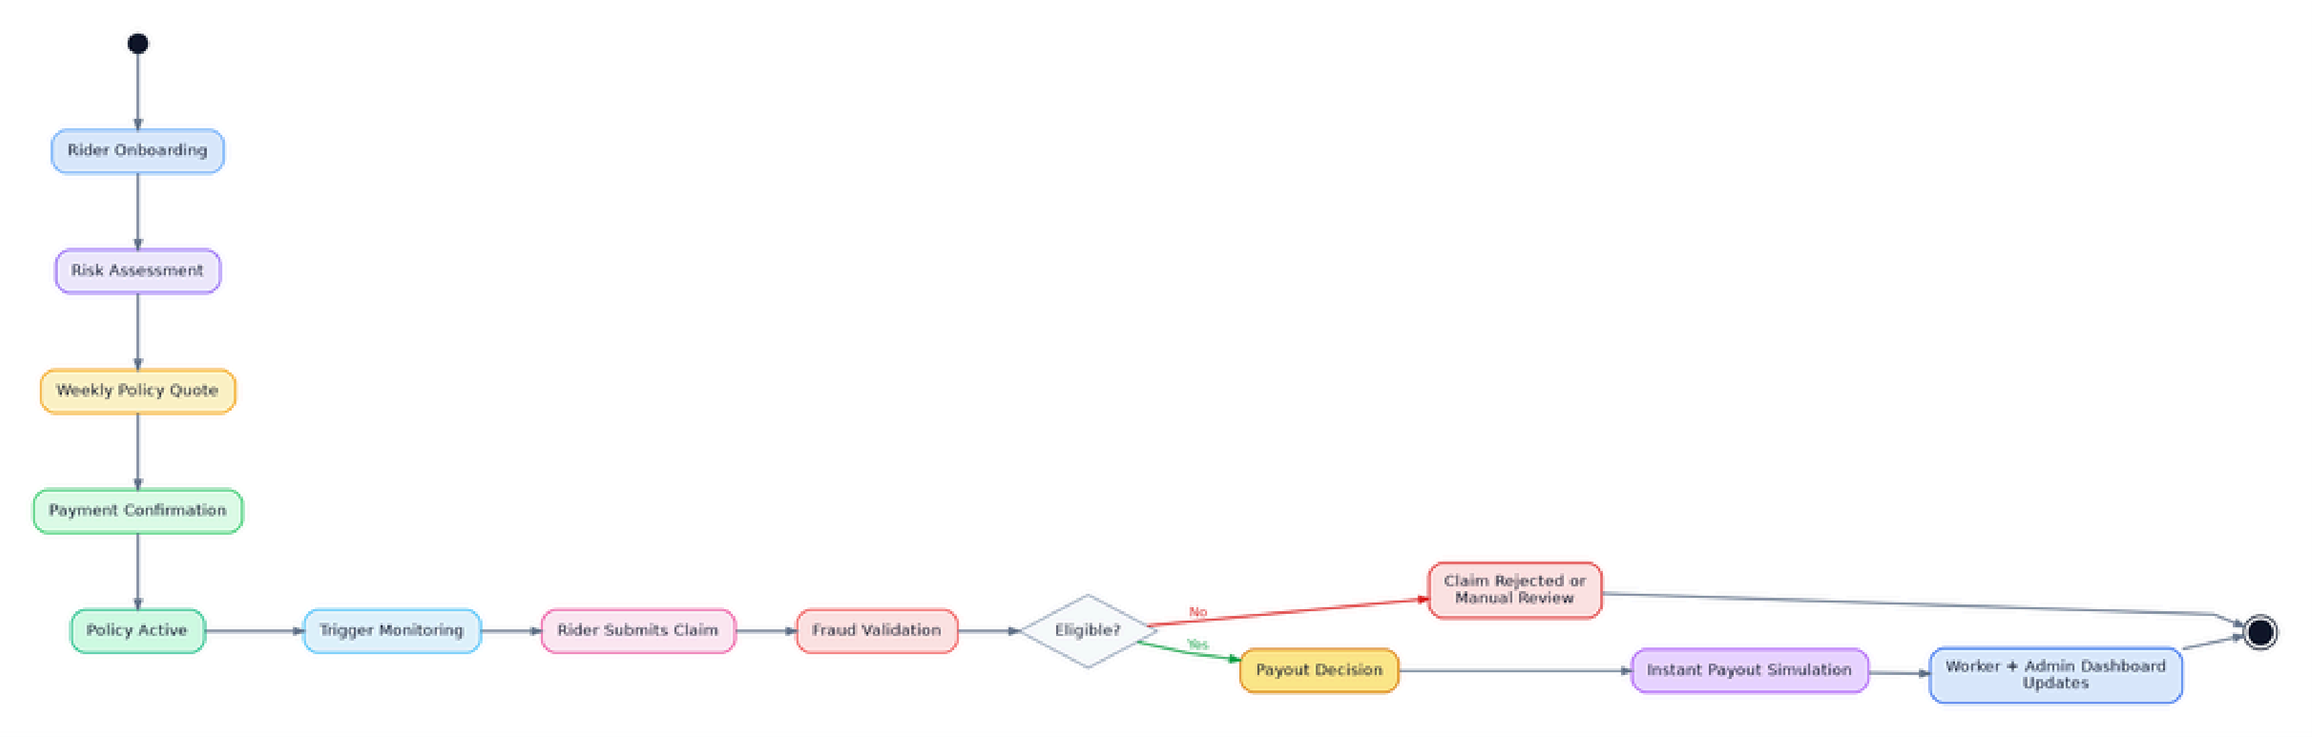
PLATFORM ARCHITECTURE

- Rider App for onboarding, policy purchase, claim submission, live coverage card
- Admin Dashboard for onboarding, policy purchase, claim submission, live coverage card
- FastAPI backend for risk scoring, fraud agent, payout agent, trigger polling, analytics APIs

SYSTEM ARCHITECTURE



PRODUCT FLOW



CLAIM PROCESSING FLOW

- Rider submits claim → trigger snapshot stored
- Fraud agent runs: location · duplicate/frequency trigger evidence · behavior
- Eligible → payout agent calculates amount
- Instant payout simulated (Razorpay-compatible)
- Status updated in both rider and admin views

INTELLIGENCE LAYER

- ML-based risk scoring + premium pricing using live disruption signals + rider/zone context
- Delivery-specific fraud detection
- Predictive analytics: next-week claim volume forecast by zone
- Premium preview shown to rider before purchase

WHAT WE BUILT

- Fully functional rider app with auth, policy, claims flow
- Admin dashboard with fraud review and live KPIs
- Seeded demo data + model artifacts ready to run
- REST APIs across auth, policies, claims, payments, triggers, zones

THANK YOU
